

alopass AEC integration Doc

That the problem with alopass...there is no "documentation" and the given information are in french within their website!!
here is their "hello" script to get familiar with alopass(not totally accurate with AEC)
http://www.alopass.com/dnl/AP_gallery_select.txt

here is my doc to you

in alopass administration you have to give 3 URLs

-error url(where client will be redirect if wrong code given)

-access url(where the alopass form should appear =where the user enter his code)

-doc url(where the protected doc remain on site and where client will be redirect if a good code is given for us it will be something like this

http://www.mysite.tld/index.php?option=com_acctexp&task=alopassnotification)

here is the minimum required to use alopass gateway:

A)fields

IDS :SITE_ID (given within alopass account.. in our case its a \$cfg parameter)

IDD :DOC_ID (given within alopass account.. in our case its a \$cfg parameter)

code[:user

Abis)optional field

DATA (type hidden) :these value will be return attach at the end of the "doc url" so we can put here information like invoice number

RECALL:if set to 1 , the CODE will be return attach at the end of the "doc url"

B)user information

a png image within alopass website wich give information to user on how to use alopass gateway(basically a paying vocal server which generate a valid random code on each call)

in our case:

<http://payment.alopass.com/acte/scripts/popup/access.apu?ids=165776&idd=455780⟨=fr&country=fr>

C)post url (where the alopass magic happen) :

<http://payment.alopass.com/acte/access.apu>

here is their given example:

http://www.alopass.com/webm_script.php4?SITE_ID=165776&DOC_ID=455780&LG_SCRIPT=fr_uk&TYPE_SCRIPT=ifr_ame&APERCU=1

they also give a way for developer to integrate alopass and test the user given code against their platform:

[http://www.alopass.com/check/index.php4?CODE=\\$code&SITE_ID=\\$siteid&DOC_ID=\\$docid](http://www.alopass.com/check/index.php4?CODE=$code&SITE_ID=$siteid&DOC_ID=$docid)

or

[http://payment.alopass.com/api/checkcode.apu?code=\\$CODE&auth=\\$AUTH](http://payment.alopass.com/api/checkcode.apu?code=$CODE&auth=$AUTH)

with \$auth = AUTH (given within alopass account.. in our case its a \$cfg parameter)

three kind of answer from the server :

OK (code correct)

NOK (code invalid)

ERR (invalid request)

hope it would help

feel free to ask for more information

to get help on AEC:
